REFLECTIVE

COMMUNITY DRIVEN TOKEN

INTRODUCTION

This document is intended for any investor and/or cryptocurrency researcher/developer who wishes to understand the tokenomics and the philosophy behind the Yorkie token.

In a world where new tokens are created non-stop on every blockchain, finding the right opportunities to invest in can be very difficult. Tokens like DOGE, SHIBA INU and SAFEMOON, with diverse value propositions, have struck the market with huge success due to their decentralized nature and the very fact that they are community driven tokens.

Fiat money abandoned the gold standard back in 1976 and that has turned fiat into a belief system more than an actual valuable currency. Inflation has become a problem for all fiats, some even with exponential scale like the Venezuelan Bolivar or the Argentinian Peso where inflation ranges in multiple digits every year.

Fiat money has its value backed by the mere state that is behind them. There is only a handful of options that states use to finance themselves:

1. Taxing their people
2. Waging war and taking resources
3. Confiscating
4. Minting new money (and introducing inflation)
5. Acquiring debt (and taxing their people heavier)

The states no longer think about long term or how to build a prosper community, prosper nations.

These are not theories. These are actual strategies that all states have used one time or another. Now fiat money is continuously decreasing in value against cryptocurrency, whilst governments continue printing and use anything they have at hand for an excuse. Printing money makes people poor.

Maybe not everyone sees the math behind this economic fact, but the one doing the talking today in the world is money itself. And money goes where it is most appreciated.

A COMMUNITY DRIVEN SOLUTION

Yorkie is our proposal to demonstrate that value is given by the people, by the community and by the men and women who run the project forward.

The success of Yorkie should not be measured in its price, but in the possibility that it can prove that a community together can drive and create a real asset out of thin air. This is the magic of cryptocurrency and the reason we are building Yorkie.

Our admin team, our telegram, our social media, our website. Everything is driven by the community, not by a centralized committee. From the moment it began, the token already had value and quickly became more valuable than the US dollar.

Initially set in motion by youtuber and cryptocurrency educator CodeWithJoe, the token immediately took off as the community believed in the person behind it. It was the first person, its population of one, that had set the economics in motion. Then

Yorkie got sustained by the strength of the community behind the meme and it is no longer a population of one. The passion of one became the passion of the many.

TOKENOMICS

Yorkie tokenomics are based on proven community driven economics from SHIBA INU and SAFEMOON but have a different take on how to escalate properly in the long run.

Yorkie has a very limited initial supply of 100.000 tokens. The circulating supply, however, is constantly reduced the more transactions occur in the blockchain.

For every transaction performed with Yorkie the following occurs:

- 3% of the transaction amount is redistributed among holders.
- 3% of the transaction amount is burned forever.
- 5% of the transaction is automatically added to liquidity.

The math is simple, but why do we have this distribution?

THE TEAM FUNDS

Team funds are used to perform several activities that are required for any token to thrive in the jungle of crypto:

- Graphic design
- Web design and hosting
- Auditing, certification
- Centralized Marketing
- Decentralized Marketing
- Airdrops
- Rewards for community competitions
- Occasionally for additional burn

The Team Funds wallet is the only way that the team behind Yorkie can continue pushing Yorkie to higher highs and greater market capitalization. This wallet has started with static funds which will be sold gradually to fund the before-mentioned activities, but the team is also aware that funds must not be sold too quickly so that the price won't be impacted. Additionally, once the Yorkie token has taken off, the Team Funds wallet could potentially be partially

burned, as its funds could be too massive. And yet, that burn itself would pump the price immediately which would basically redistribute the capital gains between all holders.

REFLECTIVE ECONOMICS

One of the main features of Yorkie is the redistribution of tokens for every transaction performed, whether it is a Buy or a Sell. 3% of every transaction is redistributed among all token holders. Depending on the number of tokens you hold, you get your cut from this 3%. This is a constant process that occurs in real time so you will see your Yorkie income increase automatically.

This is the way passive income is generated with Yorkie. Your Yorkie bags will increase while you sleep.

THE BURN

As we have mentioned before, 3% of the transaction amount is also immediately burned. This means that those tokens are lost forever and cannot be recovered. So, starting from an initial supply of

100.000 tokens, the circulating supply will begin to diminish gradually.

The more transactions are performed, the faster the burn. This means that the greater the adoption of Yorkie in the market, the faster the token price will appreciate.

This is pivotal to all community driven tokens. The members called holders or HODLERS are the community members that buy the token and decide to keep it regardless of the market volatility. While some short opportunities can be missed (sell higher to buy again in lower prices), it ensures them that no matter what their funds will get stronger. Redistribution increases the numbers, and Burn increases the price of those numbers.

Technically speaking, whenever a burn occurs, tokens are sent to the "dead" address in the blockchain whose main purpose is to be a black hole for tokens. This way tokens are burned in a blockchain.

THE LIQUIDITY

This might not seem like a great marketing bullet point for many, it is one of the most important points in Yorkie and why its

percentage is 5%, which is much greater than the 3% of the last two discussed points.

Liquidity ensures the investors that there will be money to withdraw (to convert to) when they decide to sell Yorkie back to BNB or the token of their choice. Without liquidity a transaction cannot occur, even if the token has a price.

Yorkie runs on the decentralized blockchain of Binance Smart Chain which we will discuss briefly, but this also means that the way to buy and sell is through market price. This is purely calculated by Offer and Demand.

Once Yorkie eventually gets listed into centralized exchanges, then parallel markets will begin and the volume of transactions will run the price. Yorkie will have different yet virtually similar prices in every market. At first, the only market you can buy or sell Yorkie at is the biggest one of them, the decentralized market in BSC.

But Yorkies are Yorkies everywhere. A Yorkie bought in an exchange can then be withdrawn to your BSC wallet and then sold at market price.

Liquidity is build up constantly through every transaction, ensuring investors that their funds are safe.

WHY BINANCE SMART CHAIN

There are many options for deploying and maintaining a cryptocurrency token nowadays. We have chosen the Binance Smart Chain for many reasons:

- Very low transaction fees when compared to other blockchains.
- Almost immediate execution times.
- BSC is run by the biggest and greatest investor in cryptocurrency, Binance.
- Decentralization is a must for any community driven token. If we were to drive this on a centralized exchange from the get-go then it would be impossible to fuel it through the strength of the community.
- There is not any strong meme coin running in BSC.

THE VISION

Yorkie is here to prove that a community driven economy can reach newer levels and become an alternative for nowadays fiat currencies. It is also here to prove itself against other cryptocurrency offers (many of them quite valuable) and offer something different. Yorkie, being an automatic liquidity community driven asset with reflective economics, immediately becomes a specific use case within the sea of options that populate the blockchain.

Developing Yorkie, building a roadmap, partnerships, listing in decentralized and centralized exchanges, listing in decentralized information brokers, and so on, are simply the very first start.

The same way DOGE, SHIBA INU and SAFEMOON have developed their use cases through their community, we will offer an alternative.

While many expect to simply moon and reach higher prices, Yorkie will be turning into the next level of DeFi-enabled decentralized

scarce asset in a world plagued with tokens with quadrillion decimals and unclear practices.

Are you ready to hold to our vision?
